

CYCLE PARITY DICHOTOMY: a Boolean fixed point exists iff every cycle is even

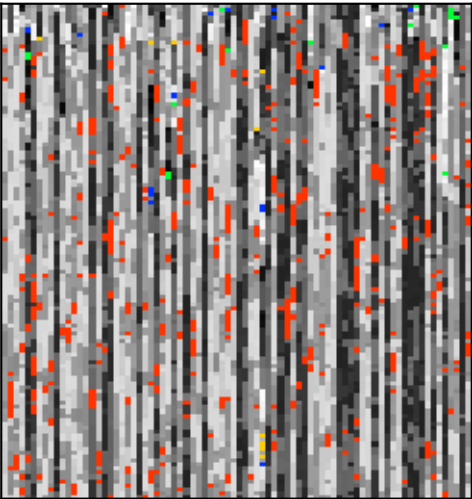

rot2 $k \rightarrow k+2$
cycles (4 4)
even, fixed pt: SETTLES

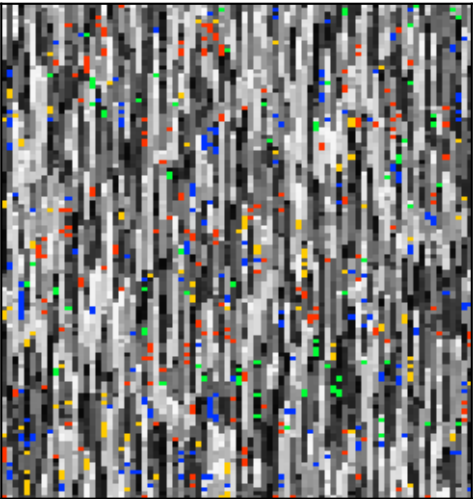

rot1 $k \rightarrow k+1$
cycles (8)
even, fixed pt: yet LIVES

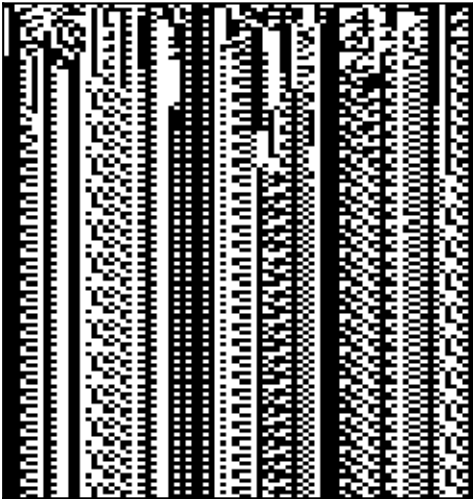

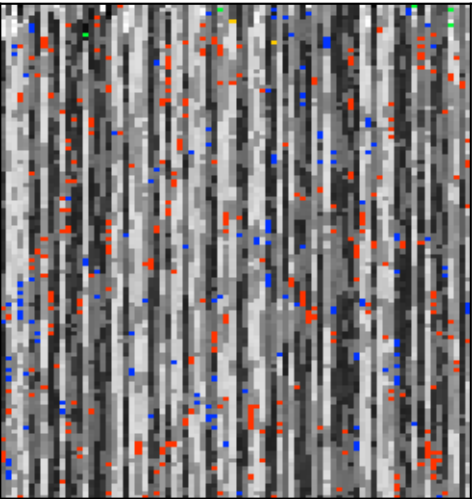

reduced rot2 {0,2,4,6}
cycles (4 1 1 1 1)
odd, no fixed pt: lives

reduced rot2 {0,2,4}
cycles (3 1 1 1 1 1)
odd, no fixed pt: lives

reduced rot2 {0,2}
cycles (2 1 1 1 1 1 1)
odd, no fixed pt: lives
